

Sorting Lines are used to grade birds according to quality and size. Shackles are specially designed to use with a weighing system included in the sorting lines. There are also sensors to keep track of the detailed information for every shackle. A computer collects information from sensors and the weighing system to decide on a drop station for each shackle, depending on the Tare, Bird Weight and Quality specs.

Our Sorting Line solution, Chickline V3.1 can be used for lines ranging from 1,000 - 8,500 bph with high accuracy rate. The maintenance of the weighing system is really simple to understand and apply. Also Operator screens are self explanatory and also highly supported with tool tips.

### Features:

- Easy to use
- Supports Turkish and English
- Two types of calibration (static & dynamic) to ensure high accuracy
- Supports up to 32 drop stations
- Can save 3 different drop station configurations
- T-Track or Sigma track overhead conveyor
